

Locking Mechanism

If the lock only turns a quarter of a turn it may be that the mechanism has been locked before it was closed.

The below image shows the locking mechanism in a locked position. If the mechanism is in this position when you shut the drawer then it will not lock.

The below image shows the mechanism in the unlocked position. If this mechanism is in the unlocked position when you close the drawers then the key will turn and you will be able to lock the drawers.
